A differential pressure Transducer is a device which can sense the difference in the pressure between the particular terminals of a device, to which it is connected. Also, it is often used for the purpose of converting pressure into a signal of an analog electrical signal. It is a common but a very important and useful pressure measuring device in industrial instrumentation and control devices. A differential transducer is also known as a differential transmitter. There are various types of a differential pressure transducer, among which, the most commonly used differential pressure transducer is strain-gauge Wheatstone bridge pressure transducer.
