Abstracts

Digital Forensics Software is a kind of software used to investigate and examine IT systems after security incidents or for security-related preventive maintenance. These tools help businesses perform in-depth analysis of IT systems to identify the cause of security incidents, outline vulnerabilities, and assist security teams in facilitating incident response processes. These tools aggregate security information from hardware, network logs, and files to present security professionals with a full picture of the likely causes of security incidents. From there, many tools identify the steps necessary to remediate the vulnerability and update policies and configurations to prevent the situation from arising again.
