Abstracts

Digital microwave system equipment is used in various communication applications like cellular, radio telecommunication, broadband, satellite, radar, and navigation. Digital microwave is a wireless communication method that in microwave frequency band uses the Line of sight (LoS) communication to transmit digital information, which includes both point-to-point and point-to-multipoint digital microwaves. Digital microwave solutions meet virtually every conceivable backhaul requirement with gigabit-per-second capabilities, they will continue to evolve to meet ever increasing capacity demands and unprecedented levels of flexibility and cost-efficiency. Digital microwave systems deliver an expanding range of capacity-enhancing technologies, increased spectrum efficiency (across a wider range of frequency bands), support for efficient IP data transmission, and growing levels of optimization and automation. Digital microwave systems serve in the areas where it is difficult to lay the optical fibres and support full packet communications for long distances.
