Abstracts

An attenuator may be defined as an electronic device, which can reduce the power of a signal without distorting its waveform. Attenuators are passive devices, which are made from simple voltage divider networks. For measuring signals, attenuator pads or adapters are used for lowering the amplitude of a signal by a known amount to enable measurements or for protecting the measuring device from signal levels that might damage it. Attenuators are also used for matching impedance by lowering apparent standing-wave ratio (SWR). Digital step attenuators are used for controlling the amplitude of an RF or analog signal. They are used in receivers and transmitters to provide gain control. Digital step attenuators consist of a digital control circuitry that is integrated with an RF attenuator core and are used in applications such as 3G and 4G cellular base stations, point-to-point nodes, repeaters, and T&M equipment.
