Logistics 4.0 in the narrower sense implies the networking and integration of logistics processes within and outside of trading companies and production facilities, right up to decentralized real-time control of logistics networks. Corresponding solutions include Cyber-Physical Systems (CPS), which consist of embedded systems interconnected via communication networks. Man and material act as “endpoints”. Other components include assistance systems such as devices with autonomous intelligence and decision-making capabilities such as cameras, detectors and self-driving cars

Digital transformation, especially the networking of logistics processes, provides more transparency in the supply and dispatch chains and thus improves improves supply chain management. This is how digitization and automation help to achieve intralogistics 4.0. In the long run, even the cargo itself could become intelligent and organize its own transport autonomously.
