Abstracts

Dimpleplasty, is a minimally invasive procedure used to create dimples in the face, most commonly within the cheeks. Dimple surgery is performed with incisions in the mouth behind the area in the cheek where the dimples are created. A temporary self-absorbing suture is used to create the dimple within the cheek. The surgery typically takes 30 minutes and can be performed under local anesthesia. Dimples tend to accentuate a smile, thus increasing the perception of attractiveness, sociability and facial beauty. The presence of dimples is inherited in an autosomal dominant fashion. with the popularity of cosmetic surgery and celebrities with dimple has been raise the demand for Dimpleplasty treatment over the forecast period. Several techniques had been described for creation of cheek dimples depending on two main principles either to excise soft tissue or to use suturing technique. The presence of dimples is inherited in an autosomal dominant fashion. The cheek dimples are expressed on chromosome 16, with variable penetrance and ultimately parents with dimples will pass this to their children which propel the demand for the creation of facial dimples, and many females seek cosmetic surgeons to achieve facial dimple. The responsive attitude of patients and physicians toward new treatment options also helps to fuel the Dimpleplasty Treatment market over the forecast period.
