Abstracts

Diode-Array Detection can be used to identify unknown peaks observed in chromatography.

There are two major advantages of diode array detection. In the first, it allows for the best wavelength(s) to be selected for actual analysis. This is particularly important when no information is available on molar absorptivities at different wavelengths.

The second major advantage is related to the problem of peak purity. Often, the peak shape in itself does not reveal that it actually corresponds to two (or even more) components. In such a case, absorbance rationing at several wavelengths is particularly helpful in deciding whether the peak represents a single compound or, in fact, a composite peak.

Diode Array Detector is equivalent to Photodiode Array Detector in this report.
