Abstracts

Direct metal laser sintering is an additive manufacturing technique that uses a laser as the power source to sinter powdered material, aiming the laser automatically at points in space defined by a 3D model, binding the material together to create a solid structure. It is similar to selective laser sintering; the two are instantiations of the same concept but differ in technical details. Selective laser melting uses a comparable concept, but in SLM the material is fully melted rather than sintered, allowing different properties.
