Abstracts

Disaster recovery as a Service, also known as DRaaS, is a cloud-based service which protects companies from losing their critical data at the time of an eventuality. It is a process in which physical or virtual servers are hosted and replicated by an outside entity in order to provide backup process, where functions of a system are assumed by secondary system components as primary components become inaccessible, in the case of any hazard. Disaster Recovery as a Service strives to reduce downtime as well as any disruptions caused to the client, customers and other stakeholders of a business in the event of disasters. Disaster Recovery Services solutions provide more than data recovery protection services as they can replicate various infrastructures and applications of business processes in the organization and ensure optimum continuity of operations of a business. DRaaS, for data recovery, can be employed in every organization whether it is small, medium or large without having any requirement of necessary expertise to configure and monitor a disaster recovery plan.
