Abstracts

Dissolved airfloatation is an operational process for thickening and clarification applications in water and wastewater treatment through the use of microscopic air bubbles as a driving force. Dissolved air floatation units are widely used in food processing applications, which tend to have water high in oil, fat, and grease content. There are mainly two types of dissolved airfloatation units, namely open tank DAF and plate pack DAF. Among these two, open tank DAFs are ideal for the treatment of wastewater, which is heavily loaded with solids. Plate pack DAFs are suited for low solid loading and high hydraulic rates.
