Distributed Storage is a concept of storing data on a number of standard servers that act as a single storage unit while the data is distributed amid the specific number of servers. One can conclude that a distributed storage system is a more advanced form of the concept of software defined storage (SDS). One of the vital reasons for the popularity of distributed data storage solutions are its flexibility. The DSS uses a standard server that is powerful. Moreover, they allow storage to act as the software application more like a database or an operating system. It therefore no longer requires any specialized storage box to handle the dedicated function of data storage management. This therefore simplifies the information technology stack and creates a single block for the data center. This in turns give the freedom of scaling by adding more servers which increases both the capacity and performance.
