At the heart of every DLP chipset is an array of highly reflective aluminum micromirrors known as the digital micromirror device (DMD). The DMD is an electrical input, optical output micro-electrical-mechanical system (MEMS) that allows developers to perform high speed, efficient, and reliable spatial light modulation. DLP chipsets allow users to obtain the maximum pattern rates for the associated DMD(s), as well as the ability to synchronize pattern display with external sensors, cameras, motors, or other devices.
