Abstracts

DNA methylation is an important component of epigenetics and plays an important role in maintaining normal cell function, genetic imprinting, embryonic development, and human tumorigenesis. Whole Genome Bisulfite Sequencing (WGBS), which treats genomic DNA with bisulfite to convert unmethylated cytosine C to uracil U, and performs whole-genome sequencing on the treated DNA Sequencing and comparison with the reference genome to achieve single-base resolution and high-accuracy methylation level analysis from the genome level, widely used in basic mechanisms such as cell differentiation, tissue development, animal and plant breeding, human health And research fields such as disease treatment.
