Abstracts

The computer-controlled dialysis machine is one of the most important products in the treatment of chronic renal patients and, in hemodialysis, it takes over a number of key functions – it pumps blood from the patient’s body through the blood lines to the dialyzer (artificial kidney or filter). There, a fluid known as dialysate transports the toxins and excess water filtered from the blood away from the body. The fluid is introduced against the flow of blood through a separate circuit that is also controlled by the dialysis machine. In addition, the device injects drugs (such as Heparin) that restrain coagulation. The system has a number of automatic monitoring and control functions that ensure a safe and efficient dialysis treatment for patients. Hemodialysis Machine with Double Pump.
