Abstracts

Double-sided PCBs are the same as single-sided PCBs, but the difference is they have two sided traces with a top and bottom layer. Double-sided PCBs can mount conductive copper and components on both sides of the printed circuit board so that the traces can cross over each other. So it leads to a higher density of boards without the need of point-to-point soldering. So it's difficult to fabricate the double-sided PCBs because they are more complex than single-sided PCBs. However, it's better to use the double-sided PCBs compared to single-sided PCBs.
