Abstracts

Eddy-Current sensors are noncontact devices capable of high-resolution measurement of the radial vibration, position and/or change of position of any conductive target. Eddy-Current sensors are also called inductive sensors. It is one type of proximity and displacement sensor. Eddy-Current sensors also belong to one type of Non-contact Position/Displacement measurement devices.

But generally 'eddy current' refers to precision displacement instruments (or nondestructive testing probes) and 'inductive' refers to inexpensive proximity switches. So this report focus on the eddy current displacement sensors not inexpensive proximity switches.
