Abstracts

Elastomer is defined as a long chain co-polymer or terpolymer (two or three different monomers in one chain) that contains adequate crosslinks among individual chains. Elastomers are polymers that offer excellent properties such as high elasticity as well as viscosity. They offer low permeability to moisture and gas; as well as high temperature resistance. Elastomers help meet the changing requirements of drug compatibility and cleanliness in pharmaceutical, medical and health care industries. They offer several beneficial properties. For instance, they possess low extractability and leachability. Elastomers are super-clean solutions for sensitive drugs and various other pharmaceutical applications such as pharmaceutical stoppers and container closures.
