Abstracts

Electric double-layer capacitors (EDLCs) are energy storage devices that have higher capacitance than other capacitors or batteries. Compared with batteries, these devices have higher power capacity, longer life cycle, and faster charging options. Instead of conventional dielectrics, EDLCs have two plates that are separated by electrolytes. These plates are layers of the same substrate. The electrical properties of these plates help to separate the charge effectively, which even highly thin physical layers cannot do. The absence of heavy dielectric materials in EDLCs eases the packaging with a larger surface area resulting in high capacitance. EDLCs can generate capacitance values in farads instead of microfarads and picofarads, which are the measurement units for capacitance.
