Abstracts

The electric trace heating is an insulated assembly, which runs the length of select surfaces, subsurface or pipes to ensure the targeted areas do not dip below freezing point. Applications of electric trace heating systems depend on essentially three different factors -- processes, size of operation and requirements of the industries. Heat may be applied to keep chemicals and fluids in liquid state, enable pumping by reducing the viscosity of the liquid and prevent hydration of gases brought about by the change in pressure of gases across pipelines, etc.
