## Abstracts

The electronic expansion valve is composed of a controller, an actuator and a sensor. The temperature sensing part of the electronic expansion valve is a thermocouple or a thermal resistor, so it can accurately reflect the change of superheat degree at low temperature and provide more accurate flow regulation. At the same time, the electronic expansion valve has large flow control range, sensitive response, rapid action and fine adjustment, which makes up for the shortcomings of capillary and thermal expansion valve that cannot be adjusted. It is more suitable for the electronic and refined management and control of electric vehicles.
