Abstracts

Automotive NVH materials, also known as noise, vibration, and harshness materials, are used to reduce unwanted noise, vibrations (oscillations due to automobile mechanics), and harshness (the level of discomfort) in automobiles. NVH materials, including molded rubbers, metal and film laminates, molded foams and engineering resins, are used to control air and structure-borne noises as well as noise generated from the interior components of the vehicles. In recent years, there has been a heightened demand for NVH materials as they absorb noise and prevent it from entering the vehicle, thereby preventing discomfort and improving the ride quality. Noise-cancellation technologies, which work by responding to the sounds around the car, is the dampening material used in EVs.
