Abstracts

Electrical bone growth stimulation is a medical technique to promote bone growth in difficult to heal fractures by applying a low electrical current to the fracture site. A variety of invasive and noninvasive interventions are used to treat fracture non-union including immobilization, casting, open or closed surgical reduction, pins, screw fixation, intramedullary rods and bone grafting. Bone growth stimulators, which may be non invasive or invasive, may be used instead of, or in addition to, other interventions to promote bone healing.
