Abstracts

An electrically adjustable focus lens is a light-focusing medium that can dynamically adjust its focal length using input electrical energy. Based on an optical fluid and polymer film combination, the core element consists of a container filled with optical fluid and sealed with a thin elastic polymer film. When current or voltage is applied to the liquid lens cell, the cell's shape changes. This change occurs within a few milliseconds and results in a change in optical power, which results in a change in focal length and WD.
