Abstracts

Electrically insulated bearings is the name given to bearings in which the bearing can block passage, and the bearing has insulation. The electrical insulation adopts a special process with excellent surface performance. A high-quality coating is sprayed on the outside of the bearing. The coating has a strong bonding force with the substrate. The insulating film can prevent the occurrence of current corrosion in the thick shaft of the motor. One of the main features of the transmission bearing is that the surface has a coating of 50-200 μ m, which has the function of insulating electricity and can generate electric flashover at a voltage below 1000V. discharge. Compared with traditional bearings, it increases the inherent insulability. This type is a long-term operation of motor design and hydropower generation due to bearing expertise and mechanical fire support. . Where it is vulnerable to electric shock or stray current flows.
