Abstracts

Electricity transmission towers are units that support power carrying conductors, i.e. overhead power lines between the generating end station and the local end substation. Electricity transmission towers play a vital role in delivering power through overhead lines by structurally supporting heavy high-voltage conductors. To transmit maximum power (110 kV or above) through overhead lines, typically towers have a height varying between 15 meters and 55 meters to withstand the tension. Normally, for heavy power transmission, HVDC (high-voltage direct-current) technology is used in long distance transmission to reduce power losses, and limit voltage drops; these DC conductors carry uniform voltage throughout their cross-sectional area. At maximum efficiency, the sending-end voltage should be equal to the receiving-end voltage, without any voltage drop out.
