Abstracts

Conductive epoxy, or electrically conductive adhesives consist of an epoxy resin, or silicone filled with randomly distributed metallic or conductive carbon particles. When it is fully cured it provides an electrically conductive pathway. Simple terms its glue with metal particles that can conduct electricity. This means it can be put on many different surfaces that solder cannot. It is also great for parts that are sensitive to heat. If you change the ratio of the filler particles to the resin, you can control the performance and conductivity of an adhesive. The higher proportion of filler particles will result in higher conductivity, but can weaken the bond strength as it will displace some of the adhesive material.
