Abstracts

A valve positioner is a proportional controller that adjusts the output to the actuator based on control system input and feedback from the valve stem position. Pneumatic and electro-pneumatic positioners are used with pneumatic actuators to control infinite valve positioning and/or to provide the greater force. The electro-pneumatic positioner is similar to the pneumatic positioner, but the input signal is an electrical signal instead of a pneumatic signal. This current becomes a pneumatic pressure that is fed to the bellows. Otherwise, this type of positioner works in the same way as a pneumatic positioner. Each of the positioners can be configured to be direct-acting or reverse-acting. The cam can also be changed to modify the performance of the valve from linear action to equal percentage or quick opening.
