It is said to be effecting central nervous system components such as hormones, neurotransmitters, neurotropic factors and neuropeptides. The process of generalize seizure is required for both the beneficial and adverse effect of ECT. Many studies have shown reduction of glucose metabolism in anterior and posterior part of brain in study of before and after procedure of ECT. Though this treatment is said to be effective for many psychiatric disorder there are significant controversies related to this procedure. Some study have concluded ECT procedure just marginally more effective that other placebo procedures. This procedure is viewed harmful by general population and mental health professionals.
