Abstracts

Electroless Copper for Multi-Layered Boards is an autocatalytic redox reaction. First, it is treated with an activator to adsorb a layer of active particles on the surface of the insulating substrate. Usually, metal palladium particles are used. Copper ions are first reduced on these active metal palladium particles, and the reduced metal copper nuclei themselves. It becomes the catalytic layer of copper ions, so that the reduction reaction of copper continues on the surface of these new copper nuclei.
