Abstracts

The electromagnetic vibrating feeder utilizes electromagnetic vibrating device to drive minerals to reciprocate in the direction of dip. When the vertical component of accelerated speed of feeder exceeds accelerated speed, minerals are tossed upward and leap forward in parabolic fashion. It takes 1/5 second to finish the rising and falling. The chute vibrates for one time and subsequently the minerals are tossed for one time. The chute vibrates at a frequency 3000/minute. Correspondingly, minerals are tossed upward and leap forward. So minerals can continuously and uniformly move forward and feeding is achieved.
