## Abstracts

With medical devices becoming smaller, more complex, and “smarter” thanks to the Internet of Things (IoT), electronic manufacturing services (EMS) companies have a rapidly growing role in the development of these advanced medical products. In fact, many of the technology advances in the medical device market are electronics-related—medical device manufacturers (MDMs) are eager to take advantage of fast-growing, data-driven consumer markets by building real-time multifunctionality into their products. Miniaturization, connectivity, mobility, data collection, and wearables usually require EMS. These consumer demands can challenge the capabilities of EMS providers—for example, next-generation electronics must occupy less space and fit into more challenging geometries.

Many applications, especially wearables, require electronics that are flexible, or that can even stretch. Sometimes, MDMs also want to retrofit electronic functions or connectivity into existing products, where the challenge is redesigning them without affecting patient familiarity with the current products or confusing the branding message.

As a result, an increasing number of MDMs outsource their EMS needs to contract manufacturers. EMS is a field that is not as familiar to MDM engineers as other aspects of device construction; they count on their EMS providers to be skilled in the latest EM technologies and have the right electrical solutions for their products, regardless of the challenges of miniaturization, unique geometries, and power needs. Highly complex electronic components often required for mission-critical tasks in medical applications may even require in-house research and development to create proprietary, one-of-a-kind solutions.
