Abstracts

Electrosurgery generators are tools that use high-frequency, alternating electrical currents to perform surgical cutting or to control bleeding by causing coagulation at the surgical site. Used in 80 percent of all surgical procedures today, electrosurgery generators are ideal for hospitals, surgical centers and clinics.

Highly versatile, Electrosurgery generators are tools used in optical, gynecological, dermatological, cardiac and a variety of other surgical procedures. These tools allow surgeons to cut, coagulate and desiccate tissue during operations.

Some benefits of using electrosurgery generators include creating precise cuts and minimizing blood loss. These generators also allow coagulation to occur in a fluid, or 'wet field,' environment, which other methods of cauterization struggle to achieve.

Electrosurgery generators are commonly used in all types of surgical procedures, so many hospitals and outpatient clinics need to have a reliable unit available at all times.
