Abstracts

ELISA stands for: enzyme-linked – immune – absorbent assay, a standard method to detect whether a biomedical target substance is present in blood, body substances or other biological material. In ELISA tests, a colour change occurs when the result is positive. The ELISA microplates are mainly used in medicine, biotechnology, and quality control in various industries. The ELISA plates are produced in different materials. Among these, polystyrene is the most common, which is used for the most optical detection microplates. The combination of the product geometry and specific thermoplastic materials results in the fact that the plates' most common manufacturing process is injection moulding. In injection molding, materials such as polystyrene and cyclo-olefin can be used for different temperatures, chemical resistance or other customer requirements.
