## Abstracts

An insulator is an electrical component which is used to provide insulation between two conductors. It can also be used to provide mechanical support in its area of application. Along with this, the insulator also resists electrical stress, and environmental stress which may arise due to weather changes. Electric insulators thus form a vital and integral component of the power T&D infrastructure. Moreover, any major electric component utilizes insulators in order to shield itself from voltage overloads that can damage sensitive instruments. Insulators have been in use since the 17th century and were initially used in the telegraph industry. On the basis of the material of construction, insulators can be categorized into ceramic, glass, and composite insulators. Initially, glass insulators were used but were soon replaced in many applications by ceramic insulators. However, the developments within the last half century have boosted the usage of composite insulators which offer better protection against contaminants such as water. Apart from this, electric insulators are widely being used by end-users that include utility, industries, and Others auxiliary use such as in traction equipment.
