Abstracts

An electromagnetic wave shield reduces the energy of electromagnetic waves by means of the reflection, absorption, and multiple reflection of the waves. By attenuating the electromagnetic waves, the shield avoids disruptions to precision equipment.

In addition, electromagnetic waves not only go straight but may also be diffracted just as light is, depending on the frequency. Accordingly, when using a shielding material, it should be kept in mind that the electromagnetic wave may be diffracted around the shield and reach the part to be shielded.
