Abstracts

Endometriosis affects a large number of women who are in their reproductive age. It is estimated to have a prevalence rate of 1 in 10 among women in the reproductive age group. The number is rising with the growing population count in that age range. Though there isn't a complete cure for this condition, effective endometriosis treatment is provided through medication which suppresses the extreme pain suffered during endometriosis. There are many assumptions to be taken in order to estimate the correct prevalence of endometriosis patients. The absolute prevalent population is always limited as most cases in developing regions are not reported. Also, the awareness and understanding of different scales of pain is very limited in most regions. Hence, cases of endometriosis often get ignored. The situation persists in not only developing or poor socio-economic countries, but developed countries like the UK, where it is assumed that around 2 million women have undiagnosed endometriosis.
