Catalysts for environmental protection usually have high catalytic activity, which can catalyze the conversion of pollutants with low concentrations into non-toxic substances; can withstand higher operating loads to save catalyst consumption and pollution control equipment investment; can be used at room temperature. Or work at a temperature that is not too high to reduce the energy consumption required for pollution control. The gas to be treated usually contains dust, heavy metals, sulfur-containing compounds, chlorine-containing compounds, acid mist, etc., so the catalyst is required to have strong anti-toxic ability, good chemical stability, and sufficient catalyst life. Sometimes, it is required to have good catalyst selectivity so as not to cause secondary pollution due to products generated by side reactions. In environmental treatment projects, since the composition, concentration and temperature of the pollutants often change, the catalyst is required to maintain its efficiency under a wide range of reaction conditions, which is different from the catalyst used in typical chemical production. of.
