Phenolic epoxy resin is also known as F-type epoxy resin. In an acidic medium, phenol is reacted with formaldehyde to obtain a novolac resin, which is then obtained by polycondensation of excess propylene oxide in the presence of sodium hydroxide. The epoxy group has high epoxy resin content, high viscosity, high crosslink density of the product after curing, and the fiber reinforced plastic has good physical and mechanical properties. Heat resistance is higher than E type epoxy resin. Mainly used in the production of various structural parts, electrical components and so on.
