Abstracts

Fan-Out Packaging can be defined as any package with connections fanned-out of the chip surface, enabling more external I/Os. Conventional fan-out packages use an epoxy mold compound to fully embed the dies, rather than placing them upon a substrate or interposer. Fan-Out packaging typically involves dicing chips on a silicon wafer, and then very precisely positioning the known-good chips on a thin “reconstituted” or carrier wafer/panel, which is then molded and followed by a redistribution layer (RDL) atop the molded area (chip and fan-out area), and then forming solder balls on top.
