Abstracts

The principle of the far-infrared drying furnace is that the far-infrared heating pipes are located in the air ducts on both sides of the far-infrared oven. According to the requirements and temperature of the material, it can be divided into top heating, bottom heating, and left and right simultaneous heating. The heating power can be controlled by the switch group. The motor delivers air with strong pressure through the air duct to make the temperature inside the oven even. In order to obtain the effect of rapid drying, the purpose of shortening the production cycle, saving energy and improving product quality is achieved.
