Abstracts

In a fecal immunochemical diagnostic test, antibodies are used to detect blood in the stool, which bind to a blood protein called hemoglobin found in red blood cells (RBC). A positive result of a fecal immunochemical diagnostic test may be a sign of colorectal cancer, polyps, ulcers or hemorrhoids. Blood vessels are usually very fragile and therefore easily damaged. The passage of stool can cause bleeding. If the fecal immunochemical diagnostic test results are positive, further colonoscopy is required for further research.
