Abstracts

An fiber optic in-line isolator is a fiber optic device used to maintain the spectral purity of the light source. The device only allows light to travel in a single direction to protect the light source from back reflections or signals. Tube isolators are important in high power applications because back reflections can damage the laser or cause mode hopping, amplitude changes or frequency shifts. Back reflections can also cause instability and power spikes. At present, isolators are widely used in fiber lasers, fiber amplifiers, laser communications, fiber sensing, scientific research and other fields.
