Abstracts

The plasma transferred arc welding process provides a high-strength metallurgical bond, which is formed between the superalloy coating overlay and the underlying component, ensuring that the coating does not become compromised even under the highest of stresses. Soft alloys, medium- and high-hardness materials, and carbide composites can be deposited on a variety of substrates to achieve diverse properties. The high-energy plasma arc melts the surface of the base material. At the same time, the powdery filler material is inserted into the arc and is molten. During solidification, a substance-to-substance bond between the filler material and the base material is created.
