## Abstracts

Fire rated glass, a new functional material used in the building and construction sector, offers good light transmission with superior fire-retardance. The glass is made using highly intensive technologies such as glazing and insulation to impart fire resistance, which primarily differentiates it among different glass types in terms of quality. In terms of appearance, fire-rated glass is similar to float glass, but it can bear temperatures up to 1000 degrees Celcius and can withstand flames for more than three hours, efficiently restricting fires from spreading further. Laminated glass accounts for a prominent market share as it prevents the shattering of glass into pieces, thereby ensuring safety.
