Abstracts

An important distinction exists between fire resistant cables and flame retardant cables, even though both of them are subjected to various fire performance tests in order to earn their respective classification. In brief, flame retardant cables are designed to resist the spread of fire into a new area. Fire resistant or fire rated cables are designed to maintain circuit integrity and continue to work for a specified period of time under defined conditions. The distinction between the two is crucial when it comes to maintaining critical circuits required for life safety or for a safe and immediate plant shutdown.
