Abstracts

Flexible manufacturing is all about adaptability – that is, the ability to adapt to changes in product requirements without compromising on quality. A flexible manufacturing system (FMS) is the production method that helps make this happen, and it can cut down both on production times and the amount of resource required.

The system is designed to adapt to changes like slight (or more significant) variations to a product, production volumes – or even the addition of entirely new products. It does this with the help of computers and machines that can automate key manufacturing processes, including machining and assembly, loading and unloading, and data processing.
