Abstracts

Flow cytometer reagents are used for calibrating, maintaining, validating and conducting or supporting the experiments. Thus, they are essential for the normal and satisfactory working of the instrument. Calibration reagents are used for validating that the instrument records the values consistent with the actual or real concentration or number of cells. These are proprietary and contain particle concentration in a narrow range. The buffers are used to maintain the pH of the solutions used in flow cytometry. Specificity reagents are used to bind selectively to the sample particles so as to ease detectability.
