Abstracts

Fluidized bed reactors are type of vessels that are used for carrying out different types of single and multiphase chemical reactions across different industries. Fluidized bed reactors are used for processes such as catalytic cracking, pyrolysis, combustion, dehydration, polymerization and gasification, among others. Due to these varied applications, fluidized bed reactors are used in industries ranging from chemicals to plastics where the manufacturing of end products require breaking down of heavier compounds into smaller and lighter compounds. In fluidized bed reactors, a gaseous or liquid fluid is flown through a catalyst, which is at times shaped as a number of spheres, at a very high velocity making the solid to behave as a fluid.
