Abstracts

The fluorine release film is based on polyethylene terephthalate (PET) and is coated with fluorine release agent on its surface. After the surface is coated with fluorine release agent, the film surface can be smooth and free of defects such as particles and bubbles. The surface is smooth and the product has excellent release effect and is a good release material. The main purpose of fluorine release film is to isolate sticky items, such as silicone tape, PI tape, etc. During production, storage or transportation, the fluorine release film protects the adhesive from contamination and deterioration. At present, the most widely used are mainly tapes or carriers of adhesive products.
