## Abstracts

Flywheel power systems, also known as flywheel energy storage (FES) systems, are power storage devices that store kinetic energy in a rotating flywheel. The flywheel rotors are coupled with an integral motor-generator that is contained in the housing. The motor-generator is used to store and then harness energy from the rotating flywheel. The use of a flywheel power system can improve the overall life and reliability of an uninterruptible power supply (UPS), harness kinetic energy in high load or cyclic braking operations, replace or augment batteries, regulate power frequency, and ultimately provide a sustainable means for energy conservation.
